    "summary": "To troubleshoot your internet connection, here are some steps
you can take:\n\n Check for outages: Visit our Network Status page and enter
your postcode to see if there are any planned or unplanned outages in your
area.\n Restart your modem: Disconnect the power supply from your modem, wait
60 seconds, and then plug it back in.\n Verify connections: Ensure all cables,
including power cables, internet cables, and nbn® equipment, are securely
plugged in and undamaged.\n Test your speed: Use the My Optus app to run a
speed test and compare your results to your expected speeds.\n Reduce connected
devices: If multiple devices are using the WiFi simultaneously, it can impact
speed. Try disconnecting some devices to improve performance.\n Connect via
cable: For a faster connection, try connecting your device directly to the
modem using an Ethernet cable.\n Reposition your modem: Place your modem in a
central location, 1-1.5m off the ground, away from large electronic devices and
in a well-ventilated area.\n Contact us: If you're still experiencing issues,
message one of our Experts through the My Optus app. \n",

Risk topics to explore on:

Topic	Risk
Prompt Injection	Prompt Injection Vulnerability occurs when an attacker manipulates a large language model (LLM) through crafted inputs, causing the LLM to unknowingly execute the attacker's intentions.
Insecure Output Handling	Insecure Output Handling refers specifically to insufficient validation, sanitisation, and handling of the outputs generated by large language models before they are passed downstream to other components and systems.
Sensitive Information Disclosure	LLM applications have the potential to reveal sensitive information, proprietary algorithms, or other confidential details through their output.
